

Quantifying Benefits of Large-Scale Coastal Restoration

Craig Fischenich and Kyle McKay
U.S. Army Engineer Research and Development Center (ERDC)
Environmental Laboratory

Environmental Benefits Analysis (EBA) Seminar
March 24, 2009

Overview

- Acknowledgements
 - EBA Research Program
 - New Orleans District
 - FWS: Ronny Paille, Tamieka Armstrong
 - NRCS: Ron Boustany
 - LACPR Habitat Evaluation Team

- Overview
 - Louisiana Coastal Protection and Restoration (LACPR)
 - Metric Selection
 - Flow Diversion Model
 - Applications
 - Future Thoughts and Closing Remarks

Louisiana Coastal Protection and Restoration (LACPR)

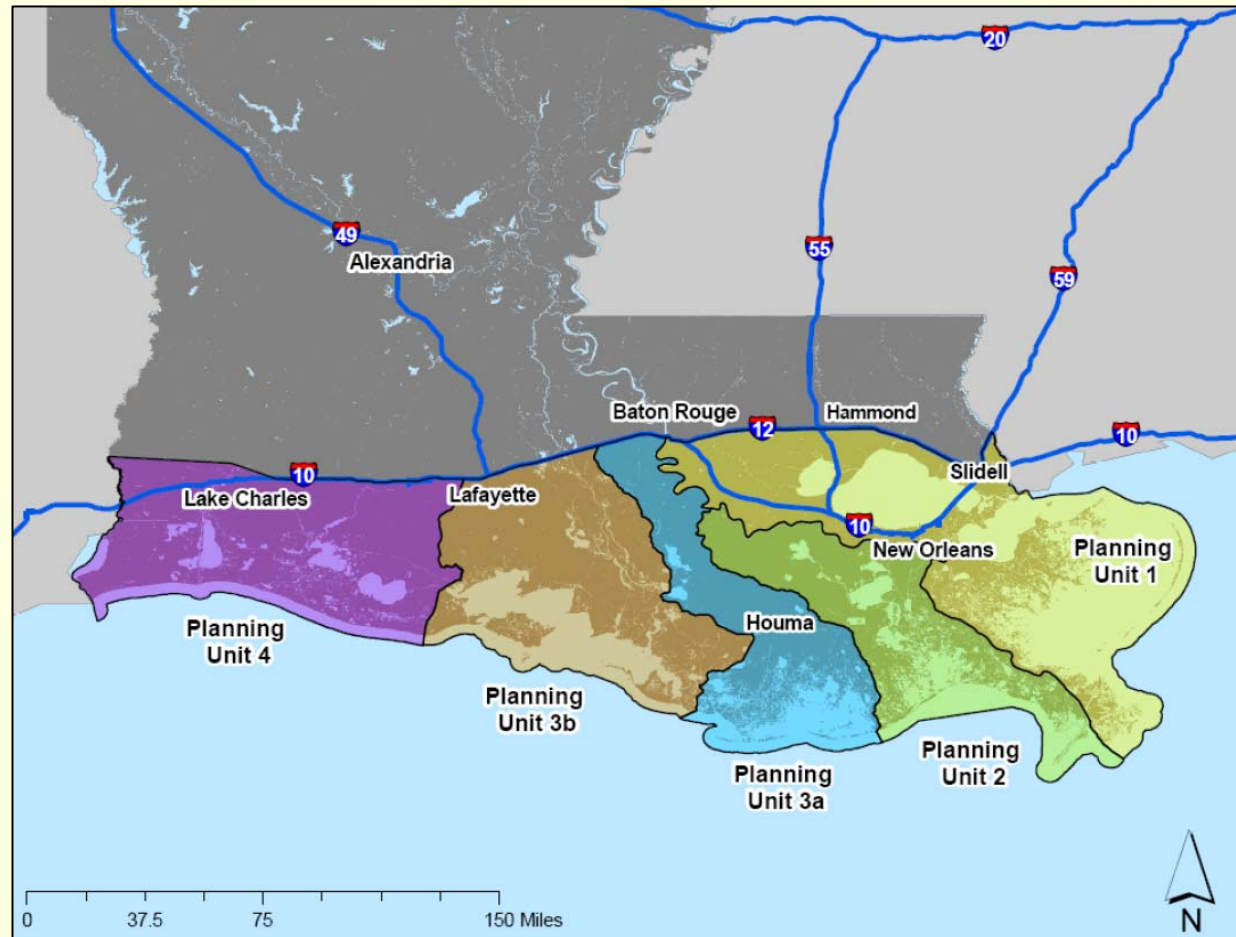

- Wetland Loss: 77 km²/yr since 1978
- Hurricanes Katrina and Rita
- Congressional Mandate to “conduct a comprehensive hurricane protection analysis and design...to develop and present a full range of flood control, coastal restoration and hurricane protection measures”
- Make recommendations to Congress

Habitat Evaluation Team (HET): Overall Aim/Approach

- Build upon previous efforts and conventional knowledge
- Identify plans that sustain the integrity of the estuarine environments
- Decisions based upon HET consensus, informed where possible by analysis and quantification
- Explicitly address uncertainty and identify means to manage risk

LACPR: Planning Units

- PU1: Pontchartrain Basin
- PU2: Barataria Basin
- PU3a: Terrebonne Basin
- PU3b: Atchafalya Basin
- PU4: Chenier Plain

Coastal Restoration: Management Measures

- Primary focus on measures that contribute to estuarine maintenance at a basin scale
- Landscape Features
 - Marsh creation
 - Ridge/Chenier restoration
 - Barrier island restoration
 - Shoreline stabilization
- Freshwater Diversions

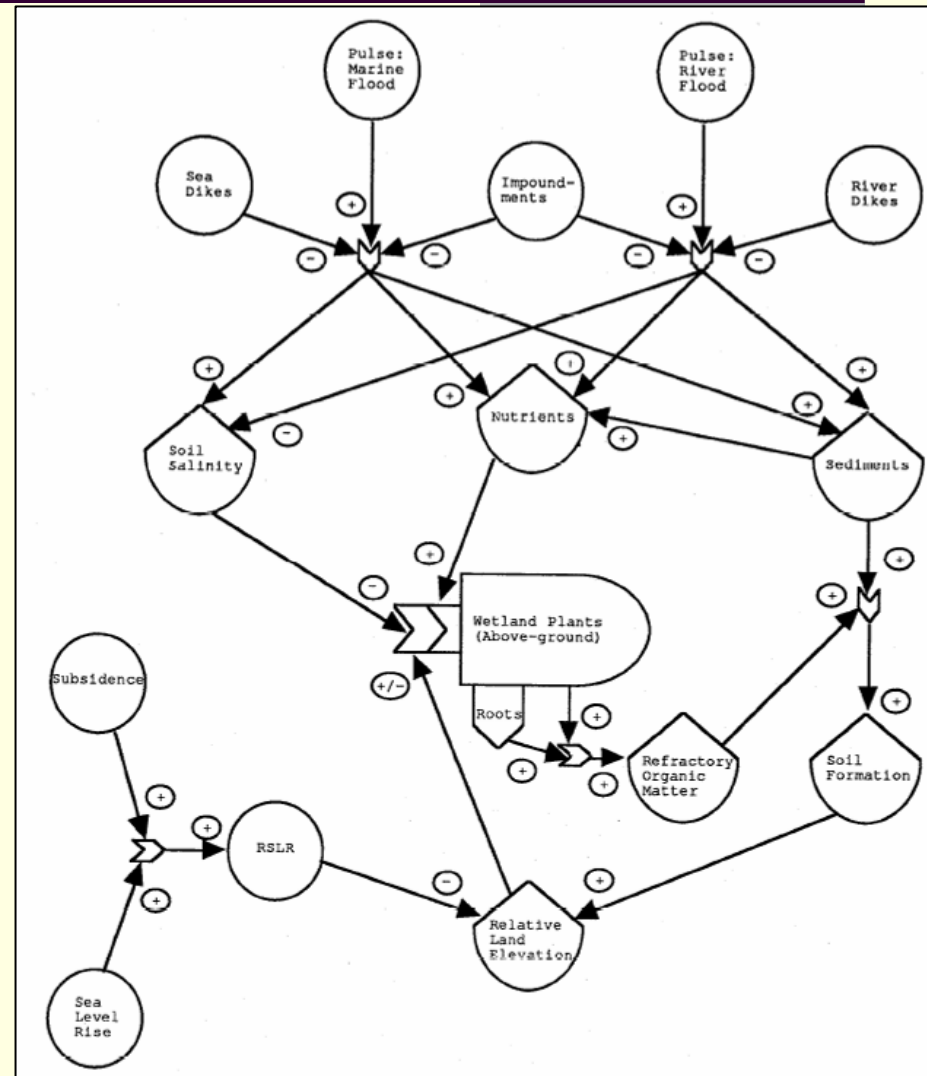

Prioritizations

PU	Creation & Protection Features	Structural Import.	Function Lifespan	Synergy w Diversion
3a	3DR-east red polys (9,10,11,16,19,21,22,28)	3	3	1
3a	Terr Bay N. Rim (JeanCh. To B.Terr)	3	3	1
3a	South Caillou Lake Landbridge MC (polys 20-22)	3	3	0.5
3a	Timbalier Islands Restoration	3	3	0
3a	Isle Demiers Restoration	3	2	0
3a	DuLarge-Grand Caillou Landbridge MC	2	3	1
3a	Small Bayou la Pointe Ridge	2	3	1
3a	3DR-east orange polys (S1,13,17,20,29,30)	2	3	0.5
3a	Bayou DuLarge Ridge	2	2	1
3a	3DR-west green polys (1,2,3,4,8)	2	2	0.5
3a	South Caillou Lake Landbridge MC (polys 19,23,24)	2	2	0
3a	Bayou Pointe au Chene Ridge	2	2	0
3a	3DR -east blue polys (8)	1	3	1
3a	3DR-west blue polys (5,6,7)	1	3	0
3a	Terr Bay N. Rim (Pt.Chen to JeanCh.)	1	2	1
3a	Margaret's Bayou Ridge	1	2	1
3a	Terr Bay N. Rim (Lafch to Pt.Chene)	1	1	1
3a	Terr Bay N. Rim (B.Terr to west end)	1	1	0
3a	Bayou Terrebonne Ridge	0	3	0
3a	3DR-east green N polys (2,7,12,14)	0	2	1
3a	3DR-east green S polys (N1,3,4,5,6,15,16,18,23-27)	0	2	0

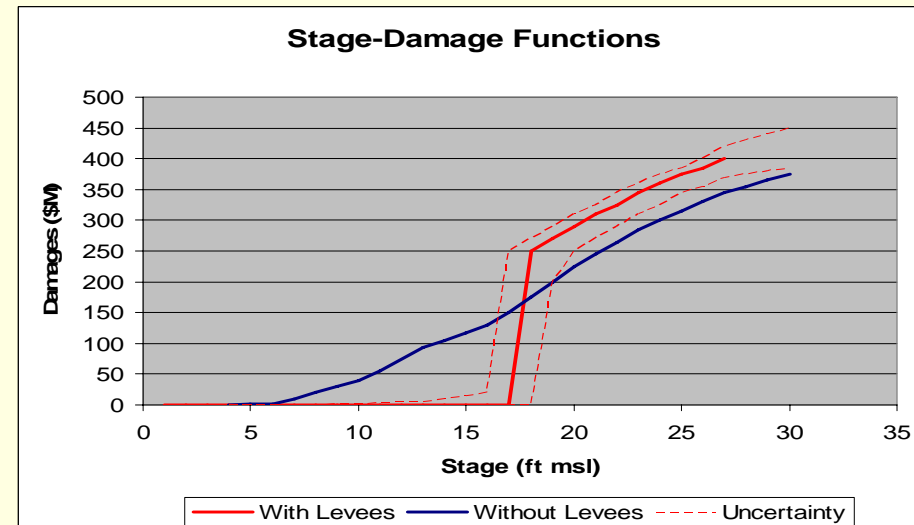

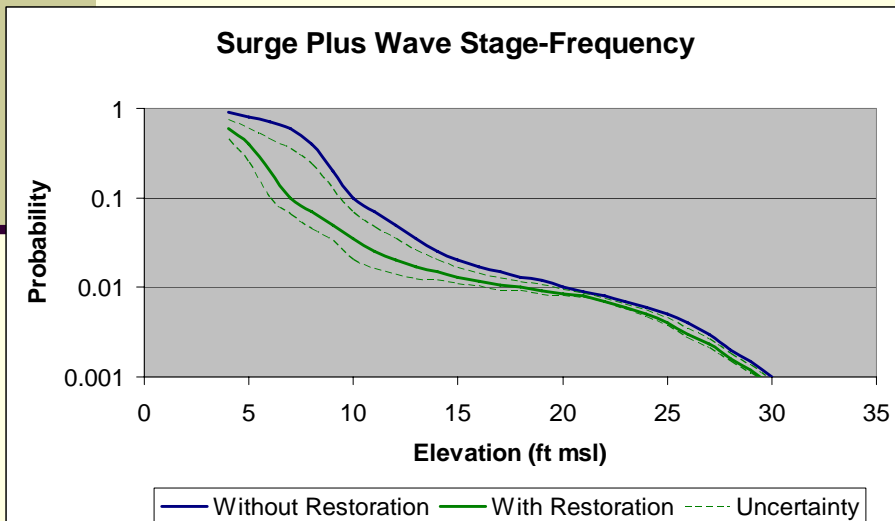

Identifying Metrics

- Conceptual Models
- Risk-Informed Decision Framework (RIDF)
 - Multi-Criteria Approach
- Coastal Restoration Metrics
 - Storm Damage Reduction
 - Estuarine Spatial Integrity
 - Wetland Acreage

Storm Damage Reduction

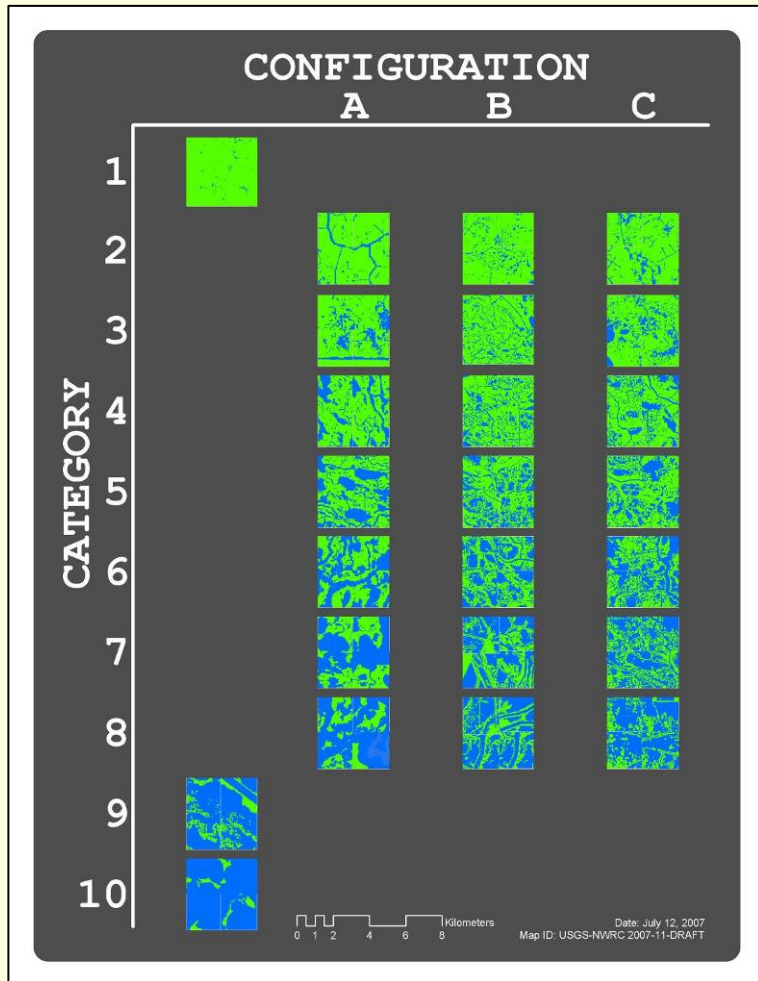

- Benefits quantified as reduction in Expected Annual Damages (\$)
- Analysis using ADCIRC-STWAVE models for with- and without-coastal features
- Uncertainty – resistance, bathymetry, economics
- Stage-frequency curve integrated with stage-damage curve for benefits

Spatial Integrity

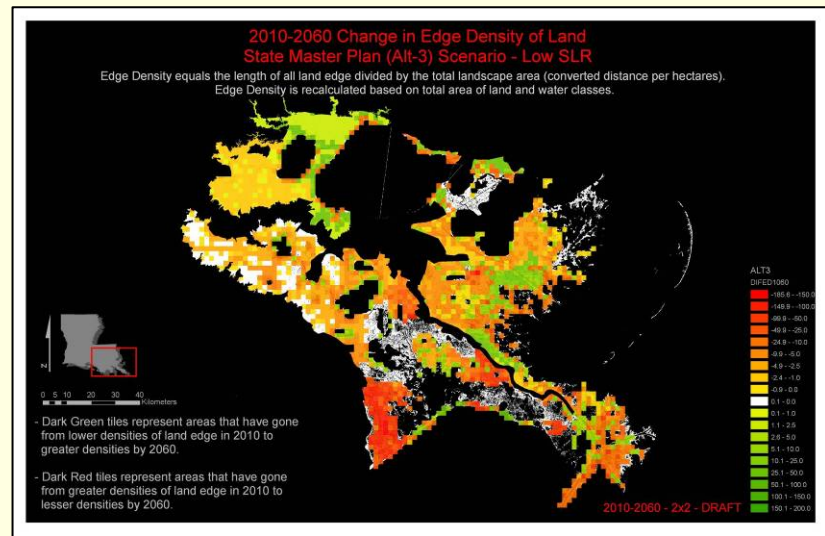

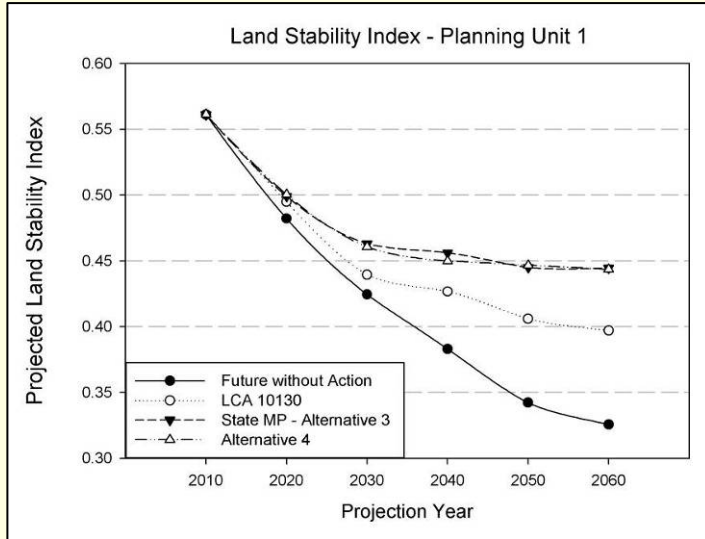

- Conceptual approach defines the landscapes by:
 - Structure: the spatial relationship among distinct wetland patches or their elements
 - Function: the flow of mineral nutrients, water, energy, or species among component patches or between landscapes
 - Change: the temporal alterations in the structure and function of landscapes or their components
- Premise: structure, function and change of patches affect fundamental ecosystem processes, which determine the trajectories of ecological condition.

Spatial Integrity Classification

Hydro Connectivity		Fisheries		Land Stability

Spatial Integrity Example (cont)

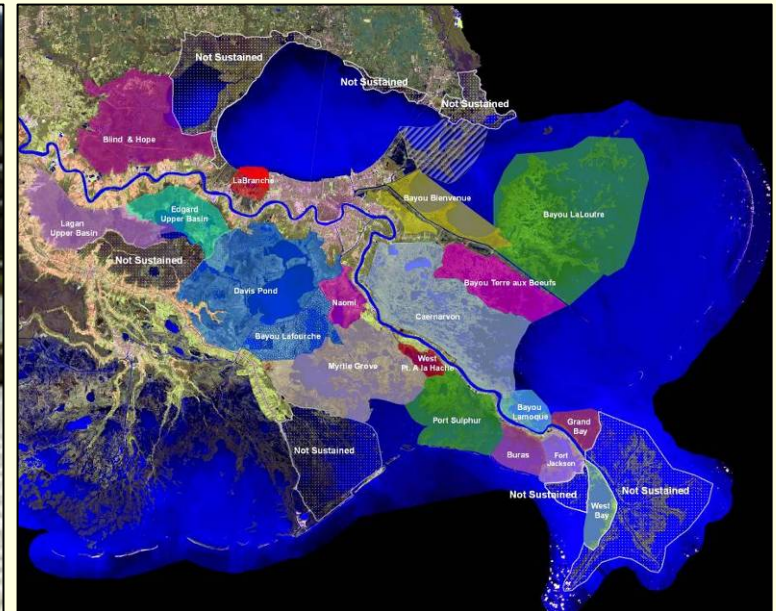

Wetland Acreage

- Existing
- Created with Dredged Material
- Created by Diversion
- Effective Land Loss Rates

Wetland Acreage: Freshwater Diversions

- Sediment and nutrient inputs offset losses due to consolidation, subsidence, SLR, erosion, etc.
- Limited replication of historic deltaic processes

Model Selection

- Selection Criteria:
 - Inorganic (sediment) and organic (nutrient-growth) components
 - Rapid application
 - Readily available data
 - Uncertainty Analysis
- CWPPRA Diversion Model

Why modify the CWPPRA model?

- Other tools were:
 - Overly complex for LACPR timeline
 - Unable to rapidly examine operational and structural differences
- Key Model Assumptions
 - Nutrients reduce land loss rate, but do NOT contribute to marsh accretion
 - Only NET nutrient increase is considered
 - Spatially uniform, simplified marsh geometry
 - Temporal resolution
 - Only represented intra-annually, not in a continuous format
 - Organic accumulation is not seasonally driven
 - No habitat switching with time
 - No vegetative component to settling/roughness
 - Additional loss mechanisms are not addressed – canals, rainfall, tidal flows, waves, or hurricanes
 - Sheetflow assumed for all diversion flow rates
 - Uniform distribution of sedimentation.

Changes to CWPRA Model

- Discharge specification options
 - Steady or varying
 - Flow duration option
 - Coupling to river flows
- Sediment loading options
 - Concentration or load
 - May be specified as a rating
- Sediment disposition computation
 - Rouse settling velocity
 - Particle size dependent
 - Accounts for flocculants
 - Includes tidal velocity
- Bulk density
- Stochastic analyses

Model Testing: Caernarvon

Uncertainty Analysis

- Parameter: Monte Carlo Simulation
- Scenario: Sea Level Rise

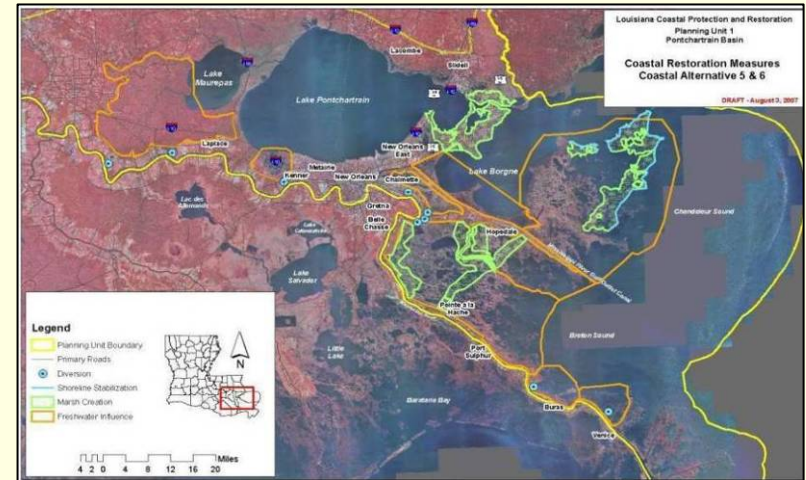

Limiting Factors

- Total diversion discharge < 525,000 cfs (confirmation and refinement needed)
- Annual sediment availability ~ 30M c.y. (figure disputed; alternate sources?)
- Mechanical marsh creation production rate roughly 900 ac/yr/dredge (total number of dredges constrained)
- Dredging costs not considered a constraint, but are a key consideration

Restoration Alternatives

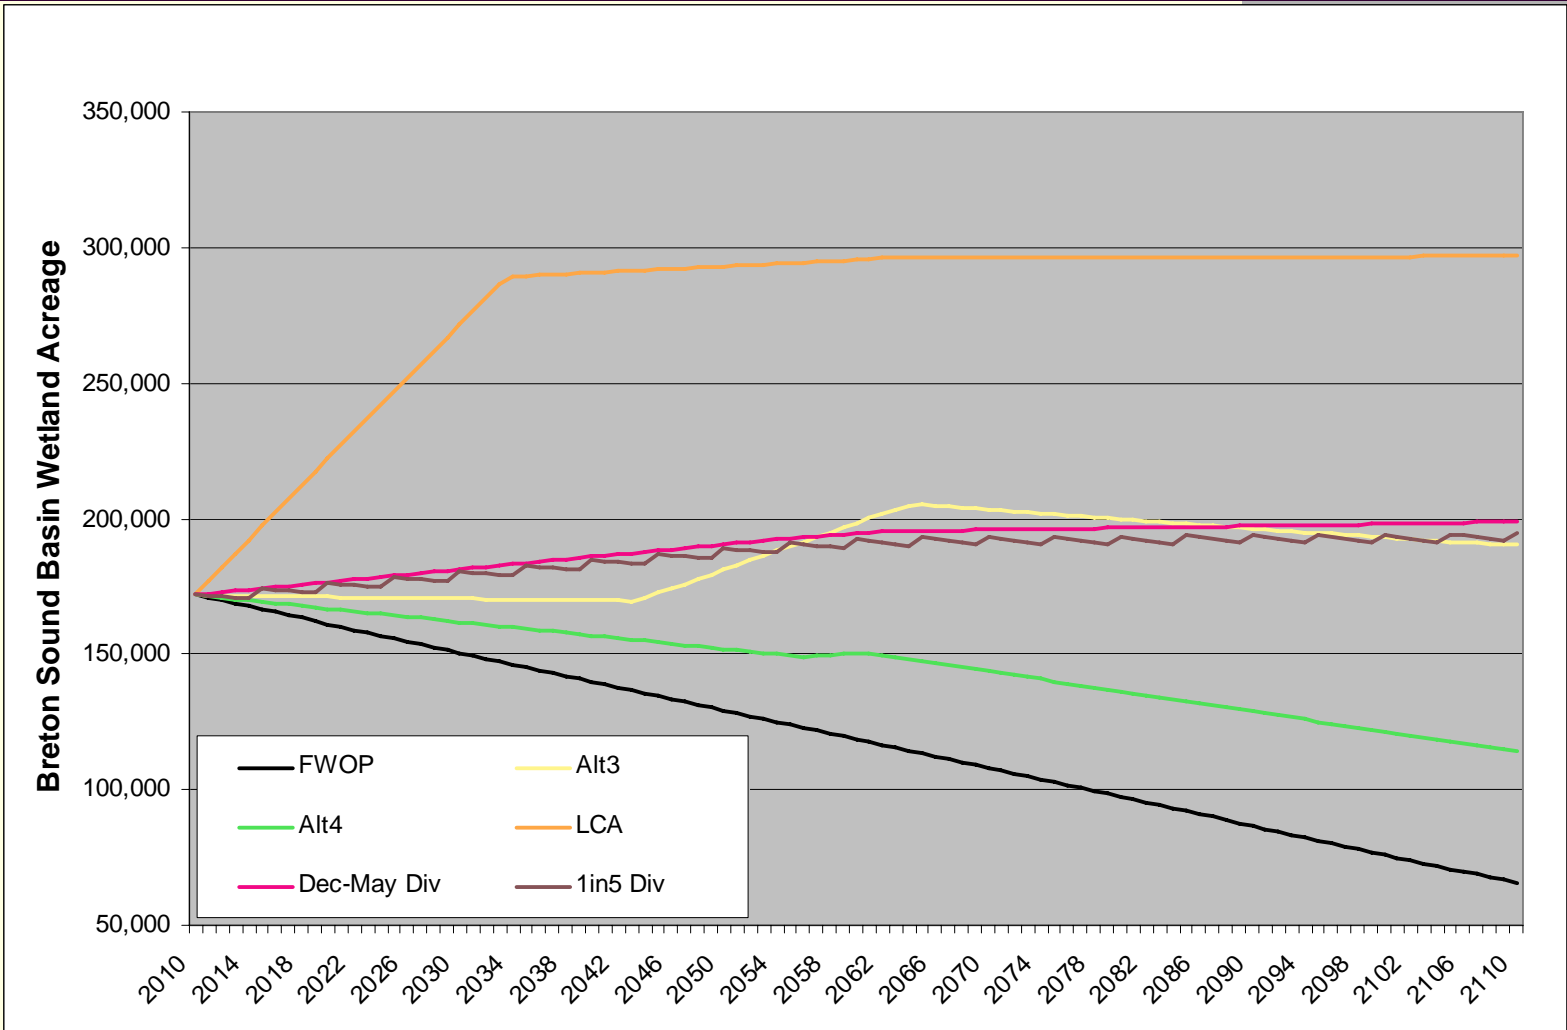

1. Do Nothing (FWOP)
2. LCA 10130 (PBMO)
3. State Master Plan
4. EIS Alternative 4
5. MC features + medium diversion
6. MC features + pulsed diversion

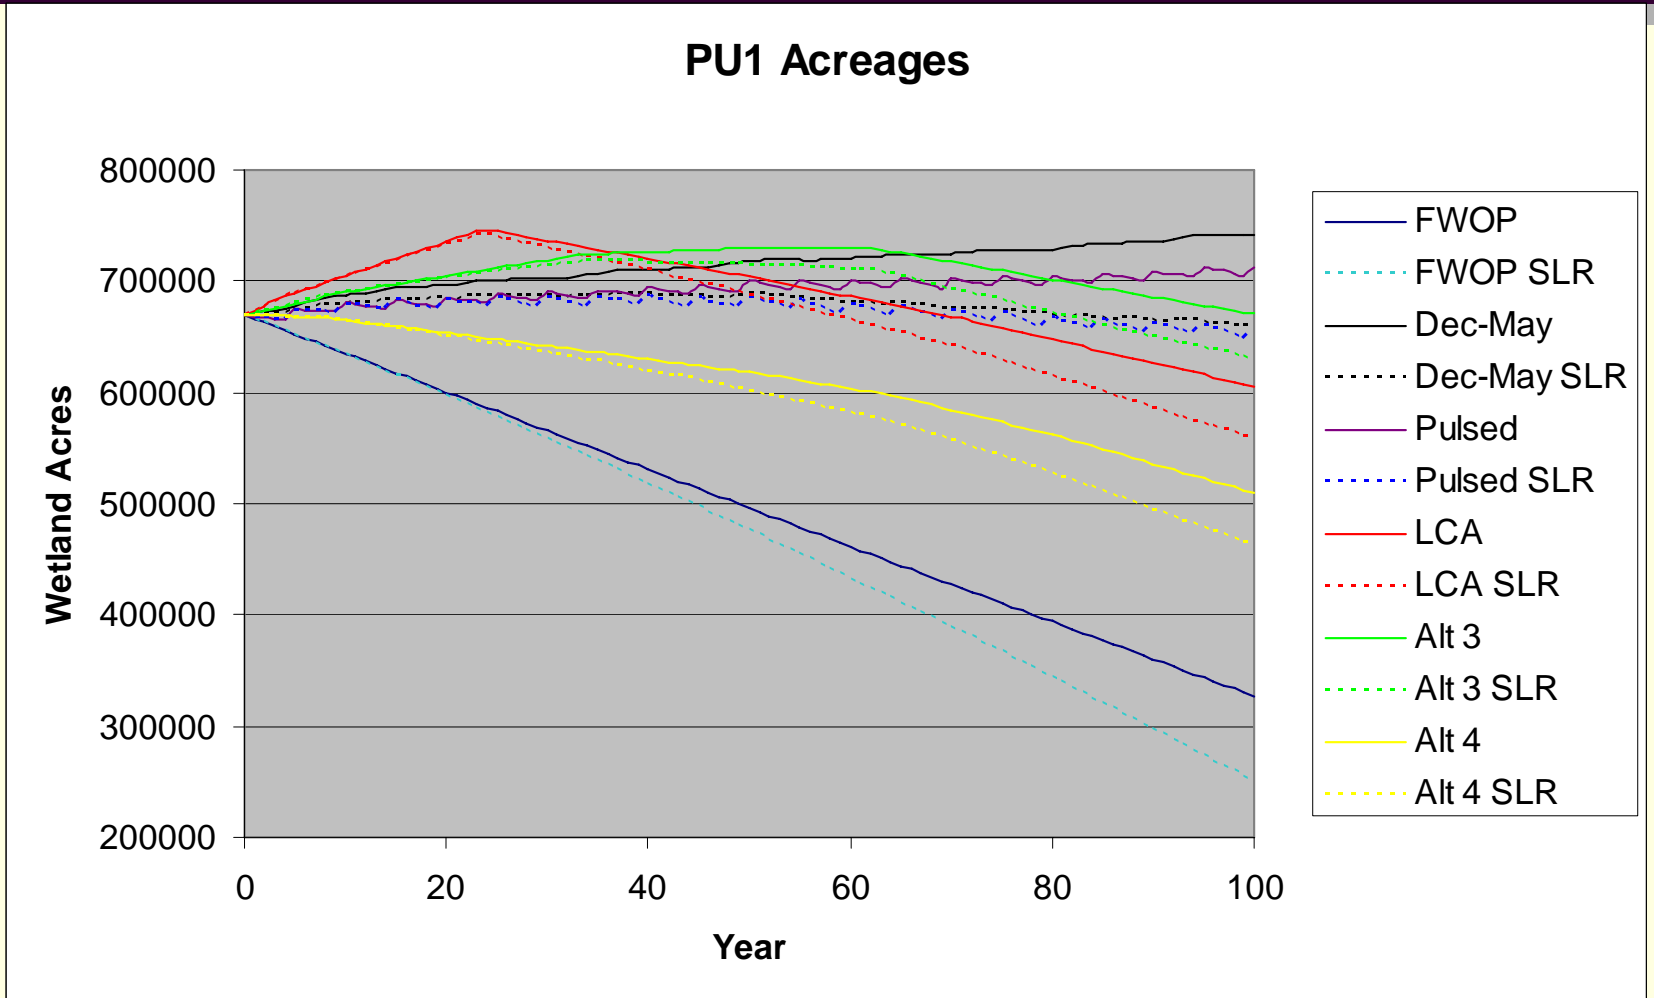

PU1-Pontchartrain; Alternative 5

- Blind River Diversion - flows for sustaining entire south Maurepas swamp split between Blind River and Hope Canal
- Hope Canal Diversion - flows for sustaining entire south Maurepas swamp split between Blind River and Hope Canal
- LaBranche Diversion – diversion directly into LaBranche wetlands to sustain those wetlands
- Bayou Bienvenu Diversion – to reduce East New Orleans landbridge loss rates by 50%
- East New Orleans land bridge Marsh Creation – 7,996 acres @ 900 acres/year
- Bayou LaLoutre Diversion – (In lieu of Violet) sized to sustain the Biloxi Marshes
- Biloxi Marshes Shore Protection – 254,500 linear feet of protection around outer perimeter
- Biloxi Marshes Marsh Creation – 33,553 acres of marsh creation with armored containment dikes where not already provided by Biloxi Marshes Shore Protection measure
- Bayou Terre aux Boeufs Diversion - flows to sustain marshes between MRGO and Bayou Terre aux Boeufs
- Bayou Terre aux Boeufs Marsh Creation – 2,591 acres in upper basin
- Breton Sound Strategic Land Bridge – a band of marsh from MRGO to Miss. River (14,579 acres) plus marsh creation along either side of Bayou LaLoutre
- Caernarvon Diversion – sized to sustain all marshes between Bayou Terre aux Boeufs and the Miss. River
- Caernarvon Area Marsh Creation – Marsh creation along protection levee from Big Mar south to Pheonix (4,936 acres)
- Bayou Lamoque Diversion – to sustain receiving area marshes
- Grand Bay Diversion – sized to sustain receiving area marshes

LACPR: Polygon Scale

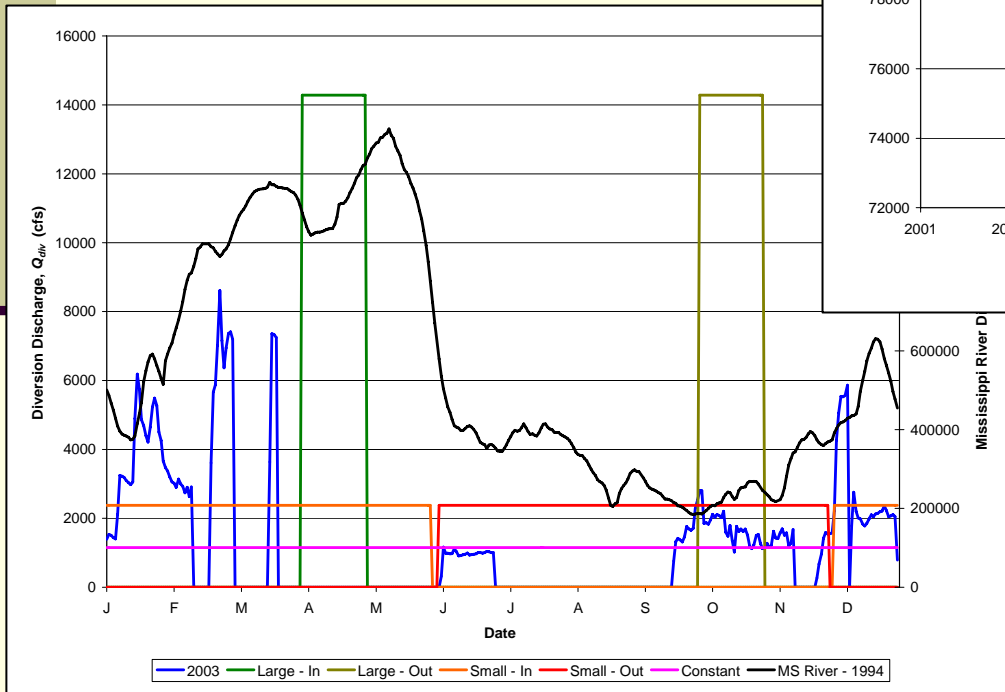

LACPR: Basin Scale

Operational Alternatives

Equal Volume Alternatives:

- Observed
- Steady flow
- Pulses – large and small
- Timing – in and out of phase with river

Structural Alternatives

- Equal Volume Alternatives:
 - Gate
 - Weirs – large and small
 - Siphon – large and small

Future Enhancement

- Donaldsonville to the Gulf
 - Spatially distributed delta growth
 - Continuous simulation
 - Land loss rate thresholds
- Future Improvements:
 - Update nutrient module to resolution of sediment module: seasonality, eutrophication, multiple limiting factors
 - Spatially distributed modeling
 - Improved hydrodynamic assessments – canals, erosion, shallow distributed flows

Conclusions

- LACPR required rapid development of alternatives and solutions
 - Multi-Criteria Approach
 - Use of conceptual models for metric identification
 - Storm Damage Reduction, Spatial Integrity, Wetland Acreage
- Flow diversion = common restoration measure
- Screening of location, magnitude, structure type, and operation was needed
- LACPR Flow Diversion Model
 - Adapted from existing tool
 - Updated based on known processes and time constraints
 - Parameter and scenario uncertainty analyses conducted
